Zirpardaz

Integrated System

Management, Ordering & Gold Sales

Management Panel

Why Zirpardaz?

Zirpardaz is not just a platform for buying and selling gold online, but a powerful tool for optimizing all management processes and trading in this industry. In this system, everything from purchase to order management is done easily and with minimal complexity. The main benefits of this system include:

1. Easy to use for customers and managers:

Zirpardaz has a simple and user-friendly design that users with any level of technical knowledge can easily use. Customers can easily check different gold products and complete their purchase in the shortest possible time without any problems.

2. Reduced workforce costs:

By using Zirpardaz software, many management and sales processes are automated, and there is no need for a large workforce for various affairs. This means reducing operational costs and improving productivity in the business.

3. Reducing gold buying complexities:

Buying gold in the traditional world is usually faced with complexities such as choosing the right price, comparing prices, and problems in transactions. Zirpardaz makes gold buying very simple and accessible by providing features such as search filters, accurate product descriptions, and transparent prices.

4. Online order management and tracking:

The ordering process is completely online and transparent. Customers are immediately informed of their order
status, and managers can track each order carefully.

5. Special discount and offer management:

The Zirpardaz system allows you to easily set and manage discounts and special offers. This capability can be
very effective for attracting more customers and increasing sales.

6. Product and category management:

Managing and adding products to the system is done simply. Managers can easily place new products in different categories and accurately enter information related to each product (such as weight, price, and specifications).

User Management

The user management system in this platform enables precise management of roles and permissions. Using this system, you can define different levels of access for each user or group of users (Role-Based Access Control - RBAC). This includes items such as accessing different parts of the system, creating, editing, or deleting information. It also provides the ability to enable or disable users, manage web service and panel users, and perform modifications (edits) for users. This feature provides administrators with complete control over the permissions and activities of users.

PRODUCT MANAGEMENT

The product management system can help improve and facilitate management processes with the following
features:

New Product Variant System with Product Features:
This system allows you to define different variants for each product, such as size, model, or material, and enter the specific features of each variant separately.

Hierarchical Category Definition for Product Variants:
In this section, you can create hierarchical structures for categories of each product. These categories can include main groups, subgroups, and even sub-collections to create order and structure in the online store.

Separate Definition for Products and Product Features:
This system allows you to define products and their specific features such as weight, dimensions, gender, etc., separately and with full detail, making information accessible in a precise and organized manner.

Image Upload System for Each Design or Variant:
For every design or product variant, it is possible to upload various images. This feature helps customers view products from different perspectives, leading to more accurate choices.

Product Wage Definition System - Purchase & Sales Wage:
This system allows defining wages for each product. Wages can be set as a currency amount or a percentage, easily used for calculating purchase and sales prices.

Product Color Definition System:
This feature allows you to define different colors for each product. In this way, customers can choose their desired color from the available options.

These features allow you to have complete management over products and their details, providing a better user experience for customers.

Order Management

For our order management system, the following features can make the order management experience simple and efficient:

View User Orders:

This feature provides the ability to view all user orders. Managers can track all active, completed, or canceled orders and easily monitor the status of each order.

View Order Details:

In this section, precise details of each order are displayed, including ordered items, wages associated with each item type, and the total of all items' wages. This information helps in more accurate management of each order.

Display Calculated Discounts:

Discounts calculated for the items of each order are clearly shown. These discounts can be applied as a percentage or a fixed currency amount based on the item type.

Separate Discount Display:

In this section, applied discounts for items are displayed separately by wage and percentage. Discounts based on amount (currency) and percentage discounts are specified individually to ensure more transparency in calculations.

Tiered Discount Definition:

This system allows you to define tiered discounts for orders. In other words, different discounts are automatically calculated and applied based on the total order amount or the number of items.

TIERED DISCOUNT

Tiered Discounts: A strategy to encourage larger purchases

The tiered discount is an effective strategy applied based on the total order weight. In this method, customers benefit from
higher discounts by purchasing more and increasing the order weight. This type of discount is applied automatically by the
system, encouraging customers to increase their purchase volume to receive better rates.

Benefits of Tiered Discounts

- **Increased Order Volume:** This method stimulates customers to buy more to reach higher discount tiers.
- **Attracting More Customers:** Attractive discount structures can lead to acquiring new customers and retaining loyal ones.
- **Cost Reduction:** By increasing purchase volume, shipping and processing costs are relatively reduced per unit.

NOTIFICATION MANAGEMENT

The notification management system empowers you to communicate effectively and purposefully with your users. This feature includes managing various notification templates and sending bulk messages, helping you relay important information quickly and in a customized manner to your users.

Passive Templates (Action-less):

In this section, you can create simple templates for notifications that do not require any specific action from the user. These templates are typically used for general announcements and one-way communication.

Active Templates (Action-based):

These templates are built based on internal system changes and allow users to perform actions after receiving the notification, such as confirming a request, filling out a form, or executing other internal system operations.

Targeted User Status Changes:

This system allows for precise targeting of users. Whether you want to notify a specific group of users or send to individual users based on their status, this feature ensures your messages reach the right people for more effective communication.

Group Messaging:

Using this feature, you can send bulk messages to various users. This capability is especially useful for quick announcements, such as declaring discounts, order statuses, or important news.

The notification management system, with the ability to define both active and passive templates, precise user targeting, and group messaging capabilities, serves as a powerful tool for effective and purposeful communication with your system's customers and users.

Supplier Management

The Supplier Management system empowers your business with robust tools to improve sourcing processes and facilitate seamless communication with your supply chain network.

1. Add New Supplier

This new system allows you to easily add new suppliers to your database. Key information including company name, supplier type, product offerings, contact details, and other specifics can be recorded accurately and systematically.

2. Search and View Suppliers

Using this system, you can view a list of existing suppliers and utilize search functionality to find specific partners quickly. Search filters based on name, mobile number, or other attributes are available, making supplier management more effective and faster.

3. Resource Linkage

Utilize this source in related resources like product manufacturing:
The system allows you to link suppliers to other related resources.
For example, you can use suppliers for required resources in product manufacturing and manage the relationship between supplier and product manufacturer with precision.

These features allow you to manage your suppliers effectively and

SUPPORT

The Support System (Ticketing System) can help improve support processes and communication with customers through the following features:

Create New Ticket:

Customers can easily create new tickets and register their requests. These requests can include technical issues, general questions, or specific needs requiring follow-up.

Comments on Tickets:

The support team or customer can leave comments on tickets to update them or
share additional information. This enables greater interaction and clarity in resolving issues.

Change Ticket Status:

The system allows the status of each ticket to be changed. For example, a ticket
status can change from "Pending Review" to "Resolved" or "Needs More Follow-up". These changes are automatically recorded in the system.

Notifications and Tracking:

The system automatically notifies users and the support team of changes in ticket status. These notifications can be sent via Email or SMS instantly to keep everything up to date and tracked.

These features allow you to effectively manage and organize your support tickets, improving customer experience.
